

HINTS FOR TUESDAY

NIGHT'S (TONIGHT'S) HOMEWORK:

Molecular Mass
Chemistry
(Final exam start January 20. See <http://www.uconn.edu>)

ANSWERS

Name _____
Period _____

1. For water...
How would you draw one molecule?

According to the periodic table, what is the mass of a mole of this molecule?
 $H: 2 \times (1.01) = 2.02$
 $O: 1 \times (16.00) = 16.00$
 18.02 grams/mole

Find the mass of 4.05 moles of this molecule.
 $4.05 \text{ moles } H_2O \times \left(\frac{18.02 \text{ grams } H_2O}{1 \text{ mole } H_2O} \right) = 73.0 \text{ grams}$

2. For nitrogen...
How would you draw one molecule?

According to the periodic table, what is the mass of a mole of this molecule?
 $N: 2 \times (14.01) = 28.02 \text{ grams/mole}$

Find the mass of 1,003,000 molecules of this substance.
 $1,003,000 \text{ molecules} \left(\frac{1 \text{ mole}}{6.02 \times 10^{23} \text{ molecules}} \right) \times \left(\frac{28.02 \text{ grams}}{1 \text{ mole}} \right) = 4.67 \times 10^{-17} \text{ grams}$

3. What is the "atomic mass" (in daltons) of sodium? 23.00 daltons

4. What is the "molar mass" (in grams) of sodium? $23.00 \text{ grams per mole}$

5. What would be the mass of 3.00 moles of calcium? Show work.

6. How many moles of cars do most people have?
 Be careful!
 $2 \text{ cars} \times \left(\frac{1 \text{ moles}}{6.02 \times 10^{23} \text{ cars}} \right) =$

ANSWER: 4.67 x 10⁻¹⁷ GRAMS

TRICKY

UNITS ARE VERY IMPORTANT - DON'T SKIP THEM!

Purpose:

Solve story problems for atoms molecules.

WARMUP:

What is the mass of this?

One oxygen is 16.00 daltons

two hydrogen is $\frac{2 \times 1.01}{18.02}$ daltons

Draw the diatomic elements

What is the molecular mass of eugenol?

Eugenol has a formula of $C_{10}H_{12}O_2$

$$C: 10 \times (12.01) = 120.1$$

$$H: 12 \times (1.01) = 12.12$$

$$O: 2 \times (16.00) = 32.00$$

What would 3.2 moles of eugenol weigh?

$$3.2 \text{ moles} \times \left(\frac{164.22 \text{ grams}}{1 \text{ moles}} \right) = 524.8 \text{ grams}$$

What would 1,000,000. molecules of eugenol weigh?

$$1,000,000 \text{ molecules} \times \left(\frac{164.22 \text{ grams}}{1 \text{ molecules}} \right) = 1.64220 \times 10^8 \text{ grams}$$

Draw the diatomic elements

ANSWERS

Name _____

Hr. _____

You may use any periodic table, including the fine one on our website or in your notes.

1. <u>C</u> Avogadro's number	a) mass of one atom
2. <u>A</u> Atomic mass	b) mass in grams of one mole of a substance
3. <u>D</u> Mole	c) the number of atoms or molecules in 1 mole of a substance
4. <u>B</u> Molar mass	d) SI unit used to measure amount (aka...number of) particles in a substance.

5. If you have 25.49g Au, how many moles of gold do you have?

$$25.49 \text{ g Au} \times \left(\frac{1 \text{ mole}}{196.97 \text{ g}} \right) = 0.1294 \text{ moles}$$

TRICKY!

6. What is the mass of one helium atom in grams?

$$1 \text{ atom He} \times \left(\frac{1 \text{ mole He}}{6.02 \times 10^{23} \text{ atoms He}} \right) \times \left(\frac{4.00 \text{ grams}}{1 \text{ mole He}} \right) = 6.64 \times 10^{-24} \text{ grams}$$

7. You have 0.50 g of helium atoms. How many grams of gold must you have to have the same number of atoms of each?

Step 1 $0.50 \text{ g He} \times \frac{1 \text{ mol He}}{4.00 \text{ g He}} = 0.125 \text{ mol He}$

Step 2 $0.125 \text{ mol He} \times \left(\frac{196.97 \text{ grams Au}}{1 \text{ mol Au}} \right) = 24.6 \text{ grams Au}$

Answer: 24.6 grams gold has the same number of atoms as 0.5 grams of Helium.

8. A lead fishing weight has a mass of 7.09g. Determine the number of moles of lead atoms in the fishing weight.

$$7.09 \text{ grams} \times \left(\frac{1 \text{ mol Pb}}{207.2 \text{ grams Pb}} \right) = 0.0342 \text{ moles}$$

9. An aluminum can has a mass of 13.5g.

a) Determine the number of moles of aluminum in an aluminum can.

$$13.5 \text{ g Al} \times \left(\frac{1 \text{ mol Al}}{26.98 \text{ g Al}} \right) = 0.500 \text{ moles Al}$$

b) Determine the number of aluminum atoms in an aluminum can.

$$0.500 \text{ mol Al} \times \left(\frac{6.02 \times 10^{23} \text{ atoms}}{1 \text{ mol Al}} \right) = 3.01 \times 10^{23} \text{ atoms}$$

10. Convert 1.75×10^{26} atoms of potassium to moles of potassium

$$1.75 \times 10^{26} \text{ atoms} \times \left(\frac{1 \text{ mole}}{6.02 \times 10^{23} \text{ Atoms}} \right) = 291 \text{ moles}$$

11. A chemist needs 4.52 moles of carbon to run a reaction, how many grams are needed to run the reaction 5 times?

$$\cancel{5 \text{ times}} \times \left(\frac{4.52 \text{ moles}}{1 \text{ time}} \right) = 22.6 \text{ moles}$$

$$22.6 \text{ moles C} \times \left(\frac{12.01 \text{ grams}}{1 \text{ moles}} \right) = \boxed{271 \text{ grams}}$$

ANSWER
